

Pharmacy GPT

Pharmacy GPT is an AI-powered web application designed to assist users in identifying possible medical conditions based on their symptoms and receiving preliminary over-the-counter (OTC) medication recommendations tailored to the Egyptian pharmaceutical market.

The system combines a medical symptom dataset with a Large Language Model (LLM) powered by **Ollama (Llama 3.2)** to deliver intelligent, context-aware healthcare guidance. Users can enter their age, gender, symptoms, and additional medical notes to receive AI-generated recommendations, home-care advice, precautions, and follow-up guidance.

One of the project's key features is its **dynamic knowledge base expansion**. When a user's symptoms are not found in the existing dataset, the application uses Ollama to generate a structured medical record, which is automatically added to the dataset for future use. This allows the system to continuously expand its knowledge base without requiring manual data entry.

Key Features

- AI-powered symptom analysis.
- Possible disease prediction.
- OTC medicine recommendations.
- Egyptian pharmaceutical market awareness.
- Medicine precautions and contraindications.
- Home-care and lifestyle recommendations.
- Interactive AI chatbot for follow-up questions.
- Dynamic dataset expansion using Ollama.
- User-friendly web interface built with Streamlit.

Technologies Used

- Python
- Streamlit
- Pandas
- LangChain
- Ollama (Llama 3.2)
- JSON
- Disease and Symptoms Dataset 2023 (Mendeley Data)

Disclaimer: Pharmacy GPT is an educational prototype developed for learning and demonstration purposes only. It is not intended to replace professional medical advice, diagnosis, or treatment.
